- **Were there any limitations that prevented you from conducting an analysis?**

The data for availability of Flu shots and the effect of flu shots for each group is not available, which would have helped to recommend preventive measures.

- **Did your data have any limitations that may have affected your results?**

In Influenza death data set, death count was missing for many records. Which is a limitation to count exact death count for each group.

- **How might you monitor the impact of the staffing changes you recommended?**

I would carry out the survey and collect feedback from medical staffs and patients which will be helpful to monitor the impact of the staffing changes I recommended.

- **Is there a metric that could be used for monitoring this impact?**

I would measure impact with following metrics:

1. Count of total Influenza deaths -if the death count decreased after preventive measures or not?
2. Patient feedback -If staff was available on time and how long was the waiting time?
